Standard Laptop Orders: Customer Journey Map

SWTID-2026-7788 | Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

SCENARIO **Requesting and receiving a standard laptop**	**Entice** How does an employee become aware of the process?	**Enter** What do they experience as they begin the request?	**Engage** In the core moments, what happens?	**Exit** What happens as the request finishes?	**Extend** What happens after the experience is over?
Steps What does the requester (or IT) typically experience?	• New hire onboarding or laptop refresh triggers a need • Employee opens the Service Catalog • Finds the Standard Laptop item	• Opens the item and fills the catalog form • Confirms model, ship-to location, needed-by date • Submits the request (RITM created)	• Flow Designer flow starts automatically • Approval checked against policy • Stock looked up; asset reserved or PO raised • Fulfillment task assigned; status updates sent	• Laptop delivered to the employee • Asset set to In Use and assigned to the user • RITM closes automatically	• Employee receives a satisfaction survey • IT reviews cycle time and stock reports • Reorder triggered when stock is low
Interactions Who, where, and what do they touch?	• People: employee, manager, HR • Places: Service Portal, Employee Center • Things: Catalog item, intranet link	• People: requester • Places: Service Portal catalog form • Things: user record auto-populates fields	• People: manager (if approval needed), fulfillment team • Places: ServiceNow, email, Teams/Slack • Things: Flow Designer, inventory/asset table	• People: employee, delivery / desk-side tech • Places: office or home address • Things: laptop, asset record	• People: requester, IT asset manager • Places: survey email, reporting dashboards • Things: performance analytics
Goals & motivations "Help me..." or "Help me avoid..."	• Help me get a laptop without chasing IT • Help me know which model I am entitled to	• Help me finish this form quickly • Help me avoid entering data IT already has	• Help me know where my order is • Help me avoid waiting on manual approvals	• Help me start using it right away • Help me avoid extra tickets for setup	• Help me give feedback easily • Help IT plan stock before it runs out
Positive moments What is enjoyable, productive, or delightful?	• Standard item is easy to find • Clear description of what is included	• Short form with pre-filled fields • Instant confirmation with request number	• Auto-approval within policy means no waiting • Status notifications at every state change	• Laptop arrives ready and already assigned to me	• Quick one-click survey • IT gets clean data with no manual reporting
Negative moments What is frustrating, confusing, or time-consuming?	• Unsure which model applies to my role • Item hard to find among many catalog entries	• Long forms and unclear approval rules • Re-typing location and department details	• Manual approvals and email back-and-forth • No visibility into status • Out-of-stock delays with no explanation	• Asset not registered or assigned, so support tickets follow • RITM left open after delivery	• Low survey response • Stock trends noticed only after shortages
Areas of opportunity How might we make each step better?	• Pre-select the model from role and department • Add a clear entitlement note on the catalog item	• Show only 3-4 fields; auto-populate the rest from the user record • Explain approval rules inline	• Auto-approve when cost is under the policy threshold • Notify at each state change • Auto-create PO on out-of-stock	• Auto-create and assign the asset record on delivery • Auto-close the RITM	• Short pulse survey on close • Dashboard for cycle time and stock; low-stock reorder flow

Flow Designer outline

1. **Trigger:** Service Catalog, when the "Standard Laptop" item is requested.
2. **Get catalog variables:** model, location, requested-for.
3. **Approval logic:** if the cost is under the policy threshold, skip approval; otherwise use Ask for Approval from the manager.
4. **Inventory check:** Look Up Records on the stock/asset table. In stock: reserve the asset and create a fulfillment task. Out of stock: create a purchase requisition or PO.
5. **Notify:** send the requester an update at each state change.
6. **On delivery:** update the asset to In Use, assign it to the user, and close the RITM.
7. **Error handling:** add an If flow for rejections and stock failures, and route failures to an IT queue.
